Welcome to Tenable Core + Tenable.sc

You can use the Tenable Core operating system to run an instance of Tenable.sc in your environment. After you deploy Tenable Core + Tenable.sc, you can monitor and manage your Tenable.sc processes through the secure Tenable Core platform.

To quickly get started with Tenable Core + Tenable.sc, see Get Started.

Features

- Secure, stable platform that reduces the time to your first scan.
- Provides automatic application installation and updates via Tenable public repositories.
- Built on CentOS 7.
- Targets Center for Internet Security (CIS) standards for RedHat 7 with SELinux enabled. For more information, see Default Security Configuration Standards.
- Root access enabled on builds.

Other Tenable Core Application Configurations

To run a different Tenable application on Tenable Core, see:

- Tenable Core + Nessus
- Tenable Core + Nessus Network Monitor
- Tenable Core + Tenable.io Web Application Scanning
- Tenable Core + Tenable.ot

Note: Tenable does not recommend deploying multiple applications on a single instance of Tenable Core. If you want to deploy several applications on Tenable Core (for example, Tenable.sc and Tenable.io Web Application Scanning), deploy a unique instance for each application.
Get Started

Tenable recommends the following sequence to deploy and get started with Tenable Core + Tenable.sc.

To get started with Tenable Core:

1. Confirm that your environment meets the requirements in Tenable Core Requirements. If necessary, prepare to increase your disk space after you deploy.
2. **Deploy or install** Tenable Core + Tenable.sc.
3. (Optional) If you want to increase your disk space to accommodate your organization’s data storage needs, see Disk Management.
4. (Optional) If Dynamic Host Configuration Protocol (DHCP) is not available on the network where you deployed Tenable Core, configure an IP address for your Tenable Core + Tenable.sc deployment.
5. (Optional) If necessary, log in as a wizard user and create an administrator account, as described in Create an Initial Administrator User Account.

**Note:** You must create an administrator account if you deployed Tenable Core + Tenable.sc via one of the following methods:
- As a virtual machine
- On hardware

If you deployed Tenable Core + Tenable.sc in a cloud environment and you did not create a password during deployment, you must create a password for your administrator account.

6. **Log In to Tenable Core** with your new administrator credentials.
7. (Optional) If you want to create more user accounts, see Create New User Account.
8. (Optional) If you want to configure Tenable Core to use a proxy server, see Configure a Proxy Server.

9. **Configure Tenable.sc** to meet the specifications you want for your application.
For more information about configuring and operating Tenable.sc, see the Tenable.sc User Guide.

10. Configure and manage Tenable Core. To access the application interface, see Configure and Manage.
Tenable Core Requirements

You can deploy Tenable Core + Tenable.sc on any system that meets the following Tenable Core and Tenable.sc environment requirements.

**Note:** Tenable does not recommend deploying multiple applications on a single instance of Tenable Core. If you want to deploy several applications on Tenable Core (for example, Tenable.sc and Tenable.io Web Application Scanning), deploy a unique instance for each application.

**System and License Requirements**

**Access Requirements**

**Default Security Configuration Standards**
System and License Requirements

To install and run Tenable Core + Tenable.sc, your application and system must meet the following requirements established for Tenable.sc. For more information about Tenable.sc requirements, see Tenable.sc in the General Requirements User Guide.

**Note:** Tenable Support does not assist with issues related to your CentOS 7 operating system, even if you encounter them during installation or deployment.

<td>.iso image</td>
<td>Install Tenable Core on Hardware</td>
</tr>
</tbody>
</table>

**Note:** While you could use the packages to run Tenable Core in other environments, Tenable does not provide documentation for those procedures.

License Requirements

To deploy Tenable Core + Tenable.sc, your Tenable.sc application must meet the requirements described in Tenable.sc Licensing Requirements in the General Requirements User Guide.

Tenable.sc Hardware Requirements

**Note:** Tenable does not recommend deploying multiple applications on a single instance of Tenable Core. If you want to deploy several applications on Tenable Core (for example, Tenable.sc and Tenable.io Web Application Scanning), deploy a unique instance for each application.
You can run Tenable.sc on hardware, with or without Tenable Core. For more information about Tenable Core, see the Tenable Core User Guide.

**Note:** Tenable strongly discourages running Tenable.sc or Tenable Core + Tenable.sc in an environment shared with other Tenable applications.

### Storage Requirements

Tenable recommends installing Tenable.sc on direct-attached storage (DAS) devices (or storage area networks [SANs], if necessary) with a storage latency of 10 milliseconds or less.

If you want to enable write-ahead logging (WAL), you must install Tenable.sc on DAS devices. For more information, see Tenable.sc Database Journaling Modes.

Tenable does not support installing Tenable.sc on network-attached storage (NAS).

### Disk Space Requirements

Enterprise networks can vary in performance, capacity, protocols, and overall activity. Resource requirements to consider for deployments include raw network speed, the size of the network being monitored, and the configuration of the application. Processors, memory, and network cards will be heavily based on the former. Disk space requirements will vary depending on usage based on the amount and length of time data is stored on the system.

An important consideration is that Tenable.sc can be configured to save a snapshot of vulnerability archives each day. In addition, the size of the vulnerability data stored by Tenable.sc depends on the number and types of vulnerabilities, not just the number of hosts. For example, 100 hosts with 100 vulnerabilities each could consume as much data as 1,000 hosts with 10 vulnerabilities each. In addition, the output for vulnerability check plugins that do directory listings, etc. is much larger than Open Port plugins from discovery scans.

For networks of 35,000 to 50,000 hosts, Tenable has encountered data sizes of up to 25 GB. That number is based on storage of 50,000 hosts and approximately 500 KB per host.

Additionally, during active scanning sessions, large scans and multiple smaller scans have been reported to consume as much as 150 GB of disk space as results are acquired. Once a scan has completed and its results are imported, that disk space is freed up.

</tbody>
</table>
Disk Partition Requirements

Tenable.sc installs into /opt/sc. Tenable highly recommends that you create the /opt directory on a separate disk partition. If you want to increase performance, consider using two disks: one for the operating system and one for the system deployed to /opt.

Tenable strongly recommends using high performance disks. Tenable.sc is a disk-intensive application and using disks with high read/write speeds, such as SSDs, results in the best performance.

If required disk space exists outside of the /opt file system, mount the desired target directory using the command `mount --bind <olddir> <newdir>`. Make sure that the file system is automatically mounted on reboot by editing the /etc/fstab file appropriately.

**Note:** Tenable.sc does not support using symbolic links for /opt/sc/. You can use symbolic links within /opt/sc/ subdirectories if instructed by Tenable.sc documentation or Tenable Support.

Deploying Tenable.sc on a server configured with RAID disks can also dramatically boost performance.

**Tip:** Tenable does not require RAID disks for even our largest customers. However, in one instance, response times for queries with a faster RAID disk for a customer with more than 1 million managed vulnerabilities moved from a few seconds to less than a second.

Network Interface Requirements

You can install Tenable.sc in externally connected or air-gapped environments. For more information about special considerations for air-gapped environments, see [Considerations for Air-Gapped Environments](#).

Gigabit or faster network cards are recommended for use on the Tenable.sc server. This is to increase the overall performance of web sessions, emails, LCE queries, and other network activities.
**Access Requirements**

Your Tenable Core + Tenable.sc deployment must meet the following requirements.

- [Internet Requirements](#)
- [Port Requirements](#)

**Internet Requirements**

You must have internet access to download Tenable Core files.

After you transfer a file to your machine, internet access requirements to deploy or update Tenable Core vary depending on your environment.

<table>
<thead>
<tr>
<th>Environment</th>
<th>Tenable Core Format</th>
<th>Internet Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Machine</td>
<td>VMware</td>
<td>.ova file</td>
</tr>
<tr>
<td></td>
<td>Microsoft Hyper-V</td>
<td>.zip file</td>
</tr>
<tr>
<td>Cloud</td>
<td>Amazon Web Services (AWS)</td>
<td>n/a</td>
</tr>
<tr>
<td>Hardware</td>
<td></td>
<td>.iso image</td>
</tr>
</tbody>
</table>

**Tip:** You do not need access to the internet when you install updates to Tenable Core + Tenable.sc via an offline .iso file. For more information, see [Update Tenable Core Offline](#).

**Port Requirements**

Your Tenable Core deployment requires access to specific ports for inbound and outbound traffic. Tenable.sc also requires application-specific port access. For more information, see [Port Requirements](#) in the Tenable.sc User Guide.

**Inbound Traffic**

You must allow inbound traffic to the following ports.
### Inbound Traffic

<table>
<thead>
<tr>
<th>Port</th>
<th>Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP 22</td>
<td>Inbound SSH connections.</td>
</tr>
<tr>
<td>TCP 8000</td>
<td>Inbound HTTPS communications to the Tenable Core interface.</td>
</tr>
<tr>
<td>TCP 8090</td>
<td>Inbound HTTPS communications for restoring backups.</td>
</tr>
<tr>
<td></td>
<td>Inbound communications with the file upload server.</td>
</tr>
</tbody>
</table>

### Outbound Traffic

You must allow outbound traffic to the following ports.

<table>
<thead>
<tr>
<th>Port</th>
<th>Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP 22</td>
<td>Outbound SSH connections, including remote storage connections.</td>
</tr>
<tr>
<td>TCP 443</td>
<td>Outbound communications to the appliance.cloud.tenable.com server for system updates.</td>
</tr>
<tr>
<td>UDP 53</td>
<td>Outbound DNS communications for Tenable.sc and Tenable Core.</td>
</tr>
</tbody>
</table>
Default Security Configuration Standards

By default, Tenable Core applies security configurations based on the following Center for Internet Security (CIS) standards. For more information about CIS standards, see cisecurity.org.

Note: SELinux: is enabled by default on the Tenable Core operating system.

CIS Standards

CIS Benchmarks: Tenable has implemented the following parts of the CIS Level 1 Benchmark on the Tenable Core:

CIS Level 1 - 1.x

- CIS 1.1.1.* (Disable mounting of miscellaneous filesystems)
- CIS 1.1.21 (Ensure sticky bit is set on all world-writable directories)
- CIS 1.4.* (Bootloader adjustments)
  - CIS 1.4.1 Ensure permissions on bootloader config are configured
- CIS 1.7.1.* (Messaging/banners)
  - Ensure message of the day is configured properly
  - Ensure local login warning banner is configured properly
  - Ensure remote login warning banner is configured properly
  - Ensure GDM login banner is configured - banner message enabled
  - Ensure GDM login banner is configured - banner message text

CIS Level 1 - 2.x

- CIS 2.2.* (disabled packages)
  - x11
  - avahi-server
CUPS
nfs
Rpc

CIS level 1 - 3.x

- CIS 3.1.* (packet redirects)
  - 3.1.2 Ensure packet redirect sending is disabled - 'net.ipv4.conf.all.send_redirects = 0'
  - 3.1.2 Ensure packet redirect sending is disabled - 'net.ipv4.conf.default.send_redirects = 0'
- CIS 3.2.* (ipv4, icmp, etc)
  - 3.2.1 Ensure source routed packets are not accepted - 'net.ipv4.conf.all.accept_source_route = 0'
  - 3.2.1 Ensure source routed packets are not accepted - 'net.ipv4.conf.default.accept_source_route = 0'
  - 3.2.2 Ensure ICMP redirects are not accepted - 'net.ipv4.conf.all.accept_redirects = 0'
  - 3.2.2 Ensure ICMP redirects are not accepted - 'net.ipv4.conf.default.accept_redirects = 0'
  - 3.2.3 Ensure secure ICMP redirects are not accepted - 'net.ipv4.conf.all.secure_redirects = 0'
  - 3.2.3 Ensure secure ICMP redirects are not accepted - 'net.ipv4.conf.default.secure_redirects = 0'
  - 3.2.4 Ensure suspicious packets are logged - 'net.ipv4.conf.all.log_martians = 1'
  - 3.2.4 Ensure suspicious packets are logged - 'net.ipv4.conf.default.log_martians = 1'
  - 3.2.5 Ensure broadcast ICMP requests are ignored
  - 3.2.6 Ensure bogus ICMP responses are ignored
  - 3.2.7 Ensure Reverse Path Filtering is enabled - 'net.ipv4.conf.all_rp_filter = 1'
- 3.2.7 Ensure Reverse Path Filtering is enabled - `net.ipv4.conf.default.rp_filter = 1`
- 3.2.8 Ensure TCP SYN Cookies is enabled

- CIS 3.3.* (IPv6)
  - 3.3.1 Ensure IPv6 router advertisements are not accepted
  - 3.3.2 Ensure IPv6 redirects are not accepted

- CIS 3.5.* (network protocols)
  - 3.5.1 Ensure DCCP is disabled
  - 3.5.2 Ensure SCTP is disabled
  - 3.5.3 Ensure RDS is disabled
  - 3.5.4 Ensure TIPC is disabled

CIS Level 1 - 4.x
- CIS 4.2.* (rsyslog)
  - 4.2.1.3 Ensure rsyslog default file permissions configured
  - 4.2.4 Ensure permissions on all logfiles are configured

CIS Level 1 - 5.x
- CIS 5.1.* (cron permissions)
  - 5.1.2 Ensure permissions on `/etc/crontab` are configured
  - 5.1.3 Ensure permissions on `/etc/cron.hourly` are configured
  - 5.1.4 Ensure permissions on `/etc/cron.daily` are configured
  - 5.1.5 Ensure permissions on `/etc/cron.weekly` are configured
  - 5.1.6 Ensure permissions on `/etc/cron.monthly` are configured
  - 5.1.7 Ensure permissions on `/etc/cron.d` are configured
  - 5.1.8 Ensure `at/cron` is restricted to authorized users - `at.allow`
5.1.8 Ensure at/cron is restricted to authorized users - at.deny
5.1.8 Ensure at/cron is restricted to authorized users - cron.allow

CIS 5.3.* (password/pam)

5.3.1 Ensure password creation requirements are configured - dcredit
5.3.1 Ensure password creation requirements are configured - lcredit
5.3.1 Ensure password creation requirements are configured - minlen
5.3.1 Ensure password creation requirements are configured - ocredit
5.3.1 Ensure password creation requirements are configured - ucredit

5.3.2 Lockout for failed password attempts - password-auth 'auth [default=die] pam_fai
lock.so authfail audit deny=5 unlock_time=900'
5.3.2 Lockout for failed password attempts - password-auth 'auth [success=1 default=bad] pam_unix.so'
5.3.2 Lockout for failed password attempts - password-auth 'auth required pam_fai
lock.so preauth audit silent deny=5 unlock_time=900'
5.3.2 Lockout for failed password attempts - password-auth 'auth sufficient pam_fai
lock.so authsucc audit deny=5 unlock_time=900'
5.3.2 Lockout for failed password attempts - system-auth 'auth [default=die] pam_fail
lock.so authfail audit deny=5 unlock_time=900'
5.3.2 Lockout for failed password attempts - system-auth 'auth [success=1 default=bad] pam_unix.so'
5.3.2 Lockout for failed password attempts - system-auth 'auth required pam_fai
lock.so preauth audit silent deny=5 unlock_time=900'
5.3.2 Lockout for failed password attempts - system-auth 'auth sufficient pam_fai
lock.so authsucc audit deny=5 unlock_time=900'
- 5.3.3 Ensure password reuse is limited - password-auth
- 5.3.3 Ensure password reuse is limited - system-auth
- CIS 5.4.* (user prefs)
  - 5.4.1.2 Ensure minimum days between password changes is 7 or more
  - 5.4.1.4 Ensure inactive password lock is 30 days or less
  - 5.4.4 Ensure default user umask is 027 or more restrictive - /etc/bashrc
- CIS 5.6.* (wheel group)
  - 5.6 Ensure access to the su command is restricted - pam_wheel.so
  - 5.6 Ensure access to the su command is restricted - wheel group contains root

CIS Level 1 – 6.x
- CIS 6.1.* (misc conf permissions)
  - 6.1.6 Ensure permissions on /etc/passwd- are configured
  - 6.1.8 Ensure permissions on /etc/group- are configured
Deploy or Install Tenable Core

You can run Tenable Core + Tenable.sc in the following environments.

**Note:** Tenable Support does not assist with issues related to your CentOS 7 operating system, even if you encounter them during installation or deployment.

<table>
<thead>
<tr>
<th>Environment</th>
<th>Tenable Core File Format</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>

<td>Deploy Tenable Core in Hyper-V</td>
</tr>
<tr>
<td>Cloud</td>
<td>Amazon Web Services (AWS)</td>
<td>Deploy Tenable Core in AWS</td>
</tr>
<tr>
<td>Hardware</td>
<td>.iso image</td>
<td>Install Tenable Core on Hardware</td>
</tr>
</tbody>
</table>

**Note:** While you could use the packages to run Tenable Core in other environments, Tenable does not provide documentation for those procedures.
Deploy Tenable Core in VMware

To deploy Tenable Core + Tenable.sc as a VMware virtual machine, you must download the Tenable Core + Tenable.sc .ova file and deploy it on a hypervisor.

Before you begin:

- Confirm your environment will support your intended use of the instance, as described in System and License Requirements.
- Confirm your internet and port access will support your intended use of the instance, as described in Access Requirements.

To deploy Tenable Core + Tenable.sc as a VMware virtual machine:

1. Download the Tenable Core Tenable.sc VMware Image file from the Tenable Downloads page.
2. Open your VMware VM in the hypervisor.
3. Import the Tenable Core + Tenable.sc VMware .ova file from your computer to your virtual machine. For information about how to import a .ova file to your virtual machine, see VMware Documentation.
4. In the setup prompt, configure the VM to meet your organization’s storage needs and requirements, as well as those described in System and License Requirements.
5. Launch your Tenable Core + Tenable.sc instance.

The VM boot process appears in a terminal window.

**Note:** The boot process may take several minutes to complete.

Tenable Core + Tenable.sc is fully deployed when the virtual machine boot process completes.

What to do next:

- Continue getting started with Tenable Core + Tenable.sc, as described in Get Started.
Deploy Tenable Core in Hyper-V

To deploy Tenable Core + Tenable.sc as a Microsoft Hyper-V virtual machine, you must download the Tenable Core + Tenable.sc .zip file and deploy it on the host where you want to launch Tenable Core + Tenable.sc.

Note: After you download the .zip file, you can use an external storage device to deploy it on another machine. You do not need internet access on the machine hosting Tenable Core.

Before you begin:

- Confirm your environment will support your intended use of the instance, as described in System and License Requirements.
- Confirm your internet and port access will support your intended use of the instance, as described in Access Requirements.

To deploy Tenable Core + Tenable.sc as a Hyper-V virtual machine:

1. Download the Tenable Core Tenable.sc VMware Image file from the Tenable Downloads page.

2. Navigate to your Hyper-V Manager on the machine where you want to deploy Tenable Core + Tenable.sc.

3. Extract the .zip file you previously downloaded. Extracting may take a few minutes.

4. In your Hyper-V Manager, create a new virtual machine.

   The Hyper-V Manager wizard appears.

5. In the setup wizard, adjust the virtual machine configurations to meet your organization’s storage needs, and the requirements described in System and License Requirements.

   Note: Tenable recommends that you select Generation 1 when the Hyper-V Manager wizard prompts you during the configuration.

6. When prompted to Connect to a Virtual Hard Disk in the wizard, select Use an existing virtual hard disk.
7. Click **Browse** and select the .vhd file.

8. Click **Finish**.

   The Hyper-V setup completes.

9. (Optional) If you want to increase the number of CPUs on your virtual machine:
   
   a. In the **Virtual Machines** table, right-click the row for your machine and click **Settings**.

       The settings window appears.

   b. In the **Hardware** section, click **Processor**.

   c. Modify the settings as necessary.

   d. Click **Ok**.

10. In the **Virtual Machines** table, right-click the row for your machine and click **Start** or **Connect**.

    The virtual machine load process appears in a console. The load process may take several minutes to complete.

What to do next:

- Continue getting started with Tenable Core + Tenable.sc, as described in **Get Started**.
Deploy Tenable Core in AWS

You can deploy in Amazon Web Services (AWS) via the AWS Marketplace.

Before you begin:

- Confirm your environment will support your intended use of the instance, as described in System and License Requirements.
- Confirm your internet and port access will support your intended use of the instance, as described in Access Requirements.

To deploy a Tenable Core VM in AWS:

1. Log in to AWS. For more information, see the AWS Documentation.
2. Navigate to the Amazon Marketplace.
3. In the Amazon Marketplace search bar, type Tenable Core + Tenable.sc.
4. Click the result for Tenable Core + Tenable.sc.
   The product overview page appears.
5. Click Continue to Subscribe.
   Either a terms and conditions window or the basic configurations page appears.
   a. If the terms and conditions window appears, click Accept Terms.
   b. Click Continue to Configuration.
   The basic configurations page appears.
6. Select the region where you want to operate your VM. AWS preselects fulfillment and software versions for the AMI based on your region.
7. Click Continue to Launch.
   The launch options page appears.
8. In the Choose Action drop-down box, select one of the following:
- **Launch from Website** — Continue deploying in a simplified launch page with limited configuration options. For more information, see [Deploy Tenable Core in AWS with Limited Options](#).

- **Launch through EC2** — Continue deploying in an advanced launch instance wizard with complete configuration options, including options for cloud-init. For more information, see [Deploy Tenable Core in AWS with Advanced Options](#).
Deploy Tenable Core in AWS with Limited Options

When deploying Tenable Core in Amazon Web Services (AWS), you can deploy via Amazon Elastic Cloud Compute (Amazon EC2) using a simplified launch page with limited configuration options. If you need to configure cloud-init or other advanced options, see Deploy Tenable Core in AWS with Advanced Options.

Before you begin:

- Begin deploying Tenable Core + Tenable.sc, as described in Deploy Tenable Core in AWS.

To continue deploying via the website:

1. Click the instance type you want to use to deploy Tenable Core + Tenable.sc. AWS preselects your Tenable-recommended instance type.
2. Select the virtual private cloud (VPC) where you want to launch your Tenable Core instance, based on your organization's network requirements.

   Tip: For information about your organization's network requirements, contact your system administrator.

3. In the Subnet section, select the subnet you want to use.
4. In the Security Group Settings section, create or select a security group that meets the requirements described in Port Requirements.
5. In the Key Pair Settings section, select the SSH key pair option you want to use for the default administrator account in Tenable Core.
6. Click Launch.

   AWS deploys and launches your Tenable Core instance as a virtual machine in AWS.

What to do next:

- Continue getting started with Tenable Core + Tenable.sc, as described in Get Started.
Deploy Tenable Core in AWS with Advanced Options

When deploying Tenable Core in Amazon Web Services (AWS), you can deploy via Amazon Elastic Cloud Compute (Amazon EC2) using an advanced launch instance wizard with complete configuration options, including options for cloud-init. If you want a more streamlined experience and you do not need to configure cloud-init options, see Deploy Tenable Core in AWS with Limited Options.

Before you begin:

- Begin deploying Tenable Core + Tenable.sc, as described in Deploy Tenable Core in AWS.

To continue deploying via Amazon EC2:

1. Configure the options based on the specifications you want for your instance and the requirements described in Tenable Core Requirements. For information about specific configurations in AWS, see the AWS Documentation.

2. Click the Configure Instance tab.

   In the Advanced Settings section, in the text box, add additional configurations (e.g., password, new users, groups) to your instance. For more information, see the cloud-init Documentation.

3. Click Launch.

   An SSH key pair window appears.

4. In the drop-down box, select the key pair option you want to use for your instance.

   **Caution**: Do not select the option to proceed without a key pair. If you launch your Tenable Core instance without a key pair you cannot connect to the instance, and you cannot add an SSH key pair later.

5. In the lower-left corner, click Launch Instances.

   AWS deploys and launches your Tenable Core instance as a virtual machine in AWS.

What to do next:

- Continue getting started with Tenable Core + Tenable.sc, as described in Get Started.
Install Tenable Core on Hardware

You can install Tenable Core + Tenable.sc directly on hardware using an .iso image. When you install Tenable Core via an .iso image on your computer, Tenable Core replaces your existing operating system with the Tenable Core operating system.

Before you begin:

- Confirm your environment will support your intended use of the instance, as described in System and License Requirements.
- Confirm your internet and port access will support your intended use of the instance, as described in Access Requirements.

To install Tenable Core + Tenable.sc on hardware:

1. Download the Tenable Core Tenable.sc VMware Image file from the Tenable Downloads page.
2. Boot the .iso. For more information, see your environment documentation.

   **Caution:** Booting the .iso replaces your existing operating system with the Tenable Core operating system.

   **Tip:** To monitor the progress of the installation, select Install TenableCore using serial console from the boot menu. For more information about the Tenable.ot serial console, see the Tenable.ot User Guide.

The installer installs Tenable Core + Tenable.sc on your hardware.

If there are no configuration errors, the installation begins.

If there are configurations errors, the Installation menu appears.

If you need to resolve configuration errors [!] with your 4) Installation source and/or 5) Software selection settings, you will need to Edit the Network Configuration or Edit the Proxy Configuration.

   **Caution:** Do not enter any other menus or modify any other settings.

The installation runs and the server restarts.

What to do next:
• Continue getting started with Tenable Core + Tenable.sc, as described in Get Started.
Edit the Network Configuration

During installation, you may need to edit the network configuration settings. Perform this procedure to resolve errors [!] with your 4) Installation source and/or 5) Software selection settings.

**Caution:** Do not enter any other menus or modify any other settings.

To edit the network configuration:

1. From the Installation menu, press the 8 key.
2. Press the Enter key.
3. Press the 2 key.
4. Press the Enter key.
5. Review the 1) IPv4 address or "dhcp" for DHCP, 2) IPv4 netmask, 3) IPv4 gateway, and 6) Nameservers settings and, if necessary, edit them.
6. Check 8) Apply configuration in installer.
7. Press the c key until you return to the Installation menu.
8. Press the r key to refresh the menu.
9. Confirm that settings 1-7 show an [x]. If the settings all show an [x] proceed to step 11.
10. If 4) Installation source still shows a [!]:
    Refresh the repository URL:
   a. Press the 4 key.
   b. Press the Enter key.

   The Installation Source menu appears.
c. Press the **3** key.

d. Press the **Enter** key.

   The **Installation Source** submenu appears.

e. Press the **2** key.

f. Press the **Enter** key.

   The **Specify Repo Options** menu appears.

g. Press the **c** key.

h. Press the **Enter** key.

   The system refreshes the repository URL and the **Installation** menu appears.

11. Press the **r** key to refresh the menu.

12. Press the **c** key until you return to the **Installation** menu.
Edit the Proxy Configuration

During installation, you may need to edit the proxy configuration settings to identify the proxy you want to use for internet access.

**Caution:** Do not enter any other menus or modify any other settings.

To edit the proxy configuration:

1. From the **Installation** menu, press the **3** key.
2. Press the **Enter** key.
   
   The **Proxy Configuration** menu appears.
3. Type the proxy you want to use. For example, `https://username:password@192.0.2.221:3128`.
   
   **Note:** If your password includes a special character, the special character must be HTML URL encoded.
4. Press the **Enter** key.
5. If your proxy is a man-in-the-middle proxy that intercepts SSL traffic, a prompt appears.

   **In the prompt:**
   
   1. Type **yes**.
   2. Press the **Enter** key.

      The system temporarily disables SSL verification. The system automatically re-enables SSL verification after the installation completes.

   The **Installation** menu appears.
6. Press the **4** key.
7. Press the **Enter** key.

   The **Installation Source** menu appears.
8. Press the **3** key.
9. Press the **Enter** key.
The Installation Source submenu appears.

10. Press the 2 key.

11. Press the Enter key.

   The Specify Repo Options menu appears.

12. Press the c key.

13. Press the r key, then the Enter key.

14. If necessary, continue pressing the r key, then the Enter key until 4) Installation source no longer says (Processing...).

   The system refreshes the repository URL.
Disk Management

You can use the Tenable Core interface to manage some aspects of your Tenable Core machine disk space. Tenable Core uses Linux logical volume management (LVM) for disk management.

Disk management via the Tenable Core interface assumes you understand basic LVM terminology:

- Volume group — A group of one or more physical volumes.
- Physical volume — A hard disk, hard disk partition, or RAID unit.
- Logical volume — A block of space on the volume group sized to mirror several or all of your physical volumes.
- File system — The file system on the logical volume.
- Mount point — The location where you mounted the file system in your operating system.

For more information about these concepts, see general documentation for Linux.

Tenable Core Partitions

Tenable Core installs or deploys with the following preconfigured partitions:

- /boot
- Swap
- /
- /var/log
- /opt

To add more storage space to Tenable Core (typically, in /opt), add a disk or expand a disk as described in Add or Expand Disk Space.
Add or Expand Disk Space

If you need more space in Tenable Core to meet the requirements, add space to your machine by expanding an existing disk or adding a new disk. For general information about Tenable Core disk management, see Disk Management.

Caution: You cannot reassign disk space after you have assigned the space to a file system.

To add or expand existing disk space on your Tenable Core machine:

1. Power down your machine, as instructed by your local administrator or the documentation for your local environment.
2. Add a new disk or expand an existing disk in your machine configuration, as instructed by your local administrator or the documentation for your local environment.
3. Power up your machine, as instructed by your local administrator or the documentation for your local environment.
4. Log in to Tenable Core.
   The System page appears.
5. In the left navigation bar, click Storage.
   The Storage page appears.
6. In the Filesystems section, locate the file system with /opt as the Mount Point and note the file system Name (e.g., /dev/vg0/00).
   Tip: Typically, you want to add space to /opt. To add more storage space to a less common partition (for example, / or /var/log), locate the file system for that partition.
7. Click the row for the file system Name that includes your preferred partition as the Mount Point.
   The Volume Group page appears.
8. In the Physical Volumes section, click the + button.
   The Add Disks window appears.
9. Click the check box for the space you added.
10. Click **Add**.

   The **Volume Group** page appears, updated to show the added space in the **Physical Volumes** section.

11. In the **Logical Volumes** section, expand the section for the file system **Name** that includes your preferred partition as the **Mount Point**.

12. Click **Grow**.

   The **Grow Logical Volume** window appears.

13. Use the slider to increase the size of the file system to your desired size (typically, to the new maximum).

14. Click **Grow**.

   The system expands the logical volume and the file system.

   The **Volume Group** page appears, refreshed to reflect the new size.
Manually Configure a Static IP Address

If you deploy Tenable Core in an environment where DHCP is configured, Tenable Core automatically receives network configurations (including your IP address). If DHCP is not configured, you must manually configure a static IP address in Tenable Core.

For more information about the default NIC configuration in your environment, see System and License Requirements.

Before you begin:

- Deploy or install Tenable Core + Tenable.sc, as described in Deploy or Install Tenable Core.
- Contact your network administrator and obtain your network’s netmask and the IP address for your Tenable Core + Tenable.sc deployment.

To manually configure a static IP address:

1. In the command line interface (CLI) in Tenable Core, type the following to log in as a wizard user:

   ```
   tenable-y3u1xwh1 login: wizard
   Password: admin
   ```

   A prompt appears asking if you want to configure a static IP address.

2. Press the y key.

   (Optional) If the prompt does not appear, run the following command to access the configuration user interface:

   ```
   nmtui-edit
   ```

   The list of connections page appears.

3. Select the connection you want to configure.

4. Press Tab to select <Edit>.

5. Press Enter.
The **Edit Connection** window appears.

6. In the **IPv4 Configuration** row, press **Tab** to select **<Automatic>**.

7. Press **Enter**.

8. Select **<Manual>** from the drop-down box.

9. Press **Enter**.

10. Press **Tab** to select **<Show>**.

11. Press **Enter**.

   Additional configuration fields appear.

   **Note:** Type the value for each configuration field as four numbers separated by a period. Refer to the examples for each field.

12. In the **Addresses** field, type the IPv4 IP address for your Tenable Core + Tenable.sc deployment, followed by a forward slash and your netmask.

   Example:

   192.0.2.57

13. In the **Gateway** field, type your gateway IP address.

   Example:

   192.0.2.177

14. In the **DNS servers** field, type your DNS server IP address.

   Example:

   192.0.2.176

15. Press **Tab** to select **<Add...>**.

   **Note:** Complete steps 12-15 only if you have additional DNS server IP addresses to add. Repeat for each IP address.
16. Press **Enter**.  
   An empty box appears in the **DNS servers** row.

17. In the new row, type your second DNS server IP address.  
   Example:
   
   192.0.2.8

18. Select the check the box in the **Require IPv4 addressing for this connection** row.

19. Press **Tab** to select **<OK>**.
   
   The list of connections appears.

20. Press **Tab** to select **<Quit>**.

21. Press **Enter**.  
   
   If you log in with a wizard, a prompt appears asking if you want to create an administrator account.
   
   To create an administrator account, see [Create a First-Time User Account](#).
   
   You will be logged out of the wizard account.

22. Log into the CLI using the administrator account.

23. Restart the connection using the following command:

   ```bash
   $ nmcli connection down "Wired connection 1" && nmcli connection up "Wired connection 1"
   ```

   **Note:** Restarting the connection enables the system to recognize your static IP address. You can reboot the system instead to trigger the response.

What to do next:
- Confirm that the Tenable Core nic1 MAC address matches the NIC MAC address in your VMware passive scanning configuration. If necessary, modify your VMware configuration to match your Tenable Core MAC address. For more information, see System and License Requirements.
Create an Initial Administrator User Account

The first time you access Tenable Core + Tenable.sc, you log in as a wizard user.

Then, you create an initial administrator account.

**Tip:** If you delay creating an initial administrator account, after a few minutes, the system locks you out of the wizard user account. You will need to reboot Tenable Core to proceed with the initial administrator account creation.

Before you begin:

- Deploy or install Tenable Core + Tenable.sc, as described in [Deploy or Install Tenable Core](#).

To create an initial administrator user account:

1. Navigate to the URL for your Tenable Core VM.
   
   The login page appears.

2. In the User name field, type wizard.

3. In the Password field, type admin.

4. Click Log In.

   The Create New Administrator window appears.

5. In the Username field, type the username you want to use for your administrator account.

6. In the Password field, type a new password for your administrator account.

7. Click Create Account.

   A confirmation window appears.

8. Click Finish Setup.

   Tenable Core creates your user account.

9. Click Log Out.

   Tenable Core logs you out.

What to do next:
• (Optional) If you want to log in again, see Log In to Tenable Core.

• (Optional) If you want to create another user account, see Create New User Account.

**Note:** You must log back in again before you can create a new user account.
Create a Password for the Initial Administrator User Account

If you deployed in a cloud environment and did not create a password during deployment, you cannot access the Tenable Core interface. You must create a password for your administrator account via SSH before you can access the Tenable Core interface.

You do not need to create a password via SSH when deploying in any of the other supported environments.

Before you begin:

- Confirm you have an SSH client installed that can access your Tenable Core server.

To create a password for the initial administrator user account:

1. Open a connection to Tenable Core with your SSH client via one of the following methods:
   - If your SSH client uses a command line interface (CLI), run the following command:
     
     ```
     ssh <your administrator username>@<your Tenable Core hostname or IP address>
     ```
   - If your SSH client uses a user interface, open the interface and follow the prompts to connect to Tenable Core via SSH.

     Tenable Core connects to your SSH client.

2. When prompted, provide your Tenable Core username via one of the following methods:
   - If you deployed in Amazon Web Service (AWS), type ec2-user as your username.
   - If you deployed in Microsoft Azure, type the username you configured during your deployment.

3. Run the `sudo passwd` command.

   ```
   sudo passwd "$USERNAME"
   ```

   The SSH client prompts you to provide a password.
4. Type the password you want to use for your administrator account.

5. Press **Enter**.
   
   Tenable Core assigns the password to your administrator account.

6. Run the `exit` command to log out of Tenable Core.

What to do next:

- Continue getting started with Tenable Core + Tenable.sc, as described in [Get Started](#).
Log In to Tenable Core

Log in to Tenable Core to configure and manage your Tenable Core + Tenable.sc instance in the Tenable Core interface.

Before you begin:

- Deploy Tenable Core + Tenable.sc, as described in Deploy or Install Tenable Core.

To log in to Tenable Core:

1. Navigate to the URL for your Tenable Core VM.
   The login page appears.
2. In the **User name** field, type your username.
3. In the **Password** field, type your password.
4. Select the **Reuse my password for privileged tasks** check box.
   
   **Note:** You cannot configure or manage your instance of Tenable Core + Tenable.sc if you do not select the
   **Reuse my password for privileged tasks** check box.
5. Click **Log in**.

   Tenable Core logs you in to the user interface.
Configure Tenable.sc in the Tenable.sc User Interface

After installing Tenable.sc on Tenable Core, you can navigate to the Tenable.sc interface and configure the application.

**Note:** Public key infrastructure (PKI)-based client authentication for Tenable.sc is no longer configured through Tenable Core. For more information, refer to [Configuration Settings](#) in the Tenable.sc User Guide.

1. Click **SecurityCenter**.

2. In the **SECURITYCENTER INSTALLATION INFO** section, click the URL.
The Quick Setup Guide page opens in a new tab. For more information, see Quick Setup in the Tenable.sc User Guide.
Configure and Manage

You can use the Tenable Core user interface to configure and manage Tenable Core + Tenable.sc.

View the Dashboard

You can use the **Dashboard** page to view usage statistics and manage your attached servers.

To view the Tenable Core dashboard:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).
   
   The **System** page appears.

2. Hover over the left navigation bar and click **Dashboard**.

   The **Dashboard** page appears.

You can:

<table>

</tbody>
</table>
Add a Server

To add a server:

**Note:** You can add as many servers to the Dashboard as you want.

1. Hover over the far-left navigation bar.
   The left navigation plane appears.

2. Click **Dashboard**.
   The **Dashboard** page appears.

3. Click the + icon.
   The **Add Machine to Dashboard** window appears.

4. In the **Address** field, type the IP address or host name for the server you want to add.

5. In the **Color** field, click the color you want to represent the server.

6. Click **Add**.
   A confirmation window appears.

   **Note:** If Tenable Core cannot establish authentication, the Unknown Host window appears. Contact your administrator to confirm your server’s name or IP address.

7. Click **Connect**.
   A credentials window appears.

8. Type your credentials in the **User name** and **Password** fields.

   **Note:** To synchronize your accounts so that your account information and passwords are the same across multiple servers, click the **synchronize accounts and passwords** link. Refer to the [Synchronize Accounts](#) page for more information.

9. Click **Log In**.
   Tenable Core adds the server to your list of servers in the **Servers** table.

   **Note:** If the server does not appear in the list right away, refresh the browser.
Edit a Server

To edit a server:

1. From the top bar in the Servers table, click the icon.

   A pencil icon (✍) and a trashcan icon (🗑️) appear next to each server name.

2. Click the icon.

   The Edit Server window appears.

3. Do any of the following:

   - In the Host Name box, type the name you want for your server.
   - Update the server color:
     - In the Color box, click the color bar.
       A color menu appears.
     - Click the color you want to represent the server.
       The server color changes.

4. Click Set.

   Tenable Core updates your server information.
Delete a Server

To delete a server:

1. From the top bar in the **Servers** table, click the check mark icon.
   
   A pencil icon and a trashcan icon appear next to each server name.

2. Click the trashcan icon.
   
   The server disappears from the server list.
Synchronize Accounts

If you have multiple user accounts but do not want to manage credentials for each one, you can synchronize your accounts, which allows you to seamlessly navigate between accounts without providing a different user name and password for each account.

Note: You can synchronize accounts while either adding or editing servers in the Dashboard.

To synchronize accounts:

1. While either adding or editing a server, click the Synchronize users link in the dialogue box. The SYNCHRONIZE USERS dialogue box appears with a list of your accounts.

   Note: If you are adding a server, the linked text in the dialogue box is synchronize accounts and passwords.

2. Check the boxes next the accounts you want to synchronize.

3. Click Synchronize.
Manage the System

You can use the System page to view usage statistics and manage system settings.

To manage the Tenable Core system:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.

The System page appears.

You can:

<table>
<thead>
<tr>
<th>Section</th>

</tr>
<tr>
<td></td>
<td>1. In the top-right corner of the graph, click the drop-down box.</td>
</tr>
<tr>
<td></td>
<td>2. Select a time range.</td>
</tr>
</tbody>
</table>
The system refreshes the graph.
Change Performance Profile

To change the performance profile for your Tenable Core instance:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).

   The **System** page appears.

2. In the left navigation pane, click the **System** option. The **System** page displays.

3. Click on the link next to the **Performance Profile** option in the information list that is left of the graph charts. A new window will appear displaying **Performance Profile** options.

4. Select the desired **Performance Profile**. The recommended profile is labeled in the list.

5. Click **Change Profile** to confirm the new selection.
Restart Tenable Core

To restart your Tenable Core instance:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).
   
   The **System** page appears.

2. In the left navigation pane, click the **System** option.

   The **System** page displays.

3. Next to the **Power Options** item, click the **Restart** button or select it from the drop-down box.

   A new window will appear.

4. Enter a message for the users in the text box.

5. Select the delay time from the drop down menu. This is the time that the restart will start. Choose from one of the minute increments or enter a specific time. There is also an option to restart immediately with no delay.

6. Click the **Restart** button to initiate and save the updated information.
Shut Down Tenable Core

To shut down your Tenable Core instance:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).

   The **System** page appears.

2. In the left navigation pane, click the **System** option.

   The **System** page displays.

3. Next to the **Power Options** item, click the arrow by **Restart** to display the drop down menu. Select **Shut Down**.

   A new window will appear.

4. Enter a message for the users in the text box.

5. Select the delay time from the drop down menu. This is the time that the shut down will start. Choose from one of the minute increments or enter a specific time. There is also an option to Shut Down immediately with no delay.

6. Click **Shut Down** to initiate and save the updated information.
Edit Your Tenable Core Hostname

To edit the hostname for your Tenable Core instance:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).

   The **System** page appears.

2. In the left navigation pane, click the **System** option.

   The **System** page displays.

3. Click the link next to the **Host Name** option in the information list that is left of the graph charts.

   A new window will appear with the options to enter/edit the **Pretty Host Name** and **Real Host Name**.

4. Enter the **Pretty Host Name** for the machine.

   The **Real Host Name** will update as the **Pretty Host Name** is entered.

5. Click **Change** to update the name.

   The new name will be displayed next to the **Hostname** option.
Edit Your Time Settings

To edit the system time and time zone settings for your Tenable Core instance:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.

   The **System** page appears.

2. Next to **System Time**, click the link.

   The **Change System Time** window appears.

3. In the **Time Zone** drop-down box, select your time zone.

   **Tip:** Type the first few letters of the desired time zone to filter the list.

4. In the **Set Time** drop-down box, select your preferred method for time synchronization.

   **Tip:** By default, Tenable Core is set to **Automatically using NTP**.

5. Click **Change**.

   Tenable Core saves the change.
View the System Log

You can use the **System Log** page to view errors encountered in the system. The system log lists, categorizes, and stores system issues that have occurred within the last seven days. Click on an individual entry (row) to get additional information.
Filter the System Log

Several log type filters are available. The **Everything** option is selected by default. Select another option using the drop down menu at the top of the page. The logs are listed with the most recent entry displayed first. Previous days are divided into sections with the corresponding date displayed in the header.

The logs can be filtered using the drop down menu. Click on the date to display the filter options for the logs.
Manage System Networking

You can use the Networking page to view real-time system network traffic information, interface connection options, and logs.

To manage Tenable Core system networking:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   
The System page appears.

2. In the left navigation bar, click Networking.
   
The Networking page appears.

You can:

<table>
<thead>
<tr>
<th>Section</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Graphs</td>
<td>• View a graph of the <strong>Sending</strong> (outbound) network traffic on your instance.</td>
</tr>
<tr>
<td></td>
<td>• View a graph of the <strong>Receiving</strong> (inbound) network traffic on your instance.</td>
</tr>
<tr>
<td>Interfaces table</td>
<td>• Aggregate multiple network interfaces into a single bonded interface, as described in Add a Bonded Interface.</td>
</tr>
<tr>
<td></td>
<td>• Add a team of interfaces, as described in Add a Team of Interfaces.</td>
</tr>
<tr>
<td></td>
<td>• Add a bridge to create a single aggregate network from multiple communication networks, as described in Add a Bridge Network.</td>
</tr>
<tr>
<td></td>
<td>• Add a VLAN, as described in Add a VLAN.</td>
</tr>
<tr>
<td>Networking Logs table</td>
<td>View a log of activity for the system network.</td>
</tr>
</tbody>
</table>
Add a Bonded Interface

You can add a bond to aggregate multiple network interfaces into a single bonded interface.

To add a bonded interface to Tenable Core:

1. In the left navigation pane, click the Networking option. The Networking page displays.

2. In the Interfaces heading, click the Add Bond button on the Interfaces section. A new window appears.

3. Enter a Name for the bond.

4. Select the members (interfaces) to bond to in the Members section.

5. Select an option for MAC.

6. Select the Mode.

7. Select a Primary.

8. Select the type of Link Monitoring. The recommended type is labeled in the drop down list.
9. Enter the **Monitoring Intervals** with options to link up or down delay increments.

![Bond Settings](image)

<table>

<tr>
<td>Link down delay</td>
<td>0</td>
</tr>
</tbody>
</table>

[Cancel] [Apply]
Add a Team of Interfaces

To add a team of interfaces to Tenable Core:

1. In the left navigation pane, click the Networking option. The Networking page displays.
2. In the Interfaces heading, click the Add Team button on the Interfaces section. A new window will appear.
3. Enter the Team Name.
4. Select the Ports needed for the new team.
5. Select the Runner and Link Watch from the drop down list.
6. Enter the Link up and Link down delay increments.

Team Settings

<table>
<thead>
<tr>

</tr>
<tr>
<td>Link down delay</td>
<td>0</td>
</tr>
</tbody>
</table>

[Image of Team Settings form]
Add a Bridge Network

You can add a bridge to create a single aggregate network from multiple communication networks.

To add a bridge network to Tenable Core:

1. In the left navigation pane, click the Networking option. The Networking page displays.

2. In the Interfaces heading, click the Add Bridge button on the Interfaces section. A new window will appear.

3. Enter a Name for the bridge.

4. Select the Ports that will connect to the bridge.

5. Click the box next to Spanning Tree Protocol (STP) to get additional STP options.

6. Click Apply to add the new bridge.
Add a VLAN

To add a VLAN to Tenable Core:

1. Click the Add VLAN button on the Interfaces section. A new window will appear.
2. Select the Parent from the drop down list.
3. Enter the VLAN Id and name.
4. Click Apply to confirm add the VLAN.
5. The new VLAN will display in the Interface list.

VLAN Settings

<table>
<thead>
<tr>

Manage System Storage

You can use the Storage page to view real-time system storage graphs, filesystem information, and logs. For more information, see Disk Management.

To manage Tenable Core storage:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   
   The System page appears.

2. In the left navigation bar, click Storage.
   
   The Storage page appears.

You can:

<table>
<thead>
<tr>
<th>Section</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Graphs</td>
<td>• View a graph of the Reading storage activity on your instance.</td>
</tr>
<tr>
<td></td>
<td>• View a graph of the Writing storage activity on your instance.</td>
</tr>
<tr>
<td><strong>Filesystems</strong></td>
<td>• View information about each filesystem.</td>
</tr>
<tr>
<td>Table</td>
<td>• Click a row to view additional details about the filesystem.</td>
</tr>
<tr>
<td></td>
<td>• Rename a filesystem, as described in Rename a Filesystem.</td>
</tr>
<tr>
<td></td>
<td>• Delete a filesystem, as described in Delete a Filesystem.</td>
</tr>
</tbody>
</table>
Rename a Filesystem

To rename a filesystem in Tenable Core:

1. In the left navigation pane, click **Storage**.
   
   The **Storage** page appears.

2. In the **File Systems** section, click on the individual file in the file systems list.
   
   The details page appears.

3. Click the **Rename** button in the upper right section of the window.
   
   A new window appears.

4. Enter the new name for the **File System**.

5. Click **Create**.

   The new name appears on the page.
Delete a Filesystem

To delete a filesystem in Tenable Core:

1. In the left navigation pane, click the **Storage** option. The **Storage** page displays.
2. In the **File System** section, click the individual file in the files systems list. The details page will appear.
3. Click the red **Delete** button in the system heading.
4. Confirm that you want to delete the **File System**.

```
Please confirm deletion of centos

This device has filesystems that are currently in use. Proceeding will unmount all filesystems on it.

/      /dev/centos/root

Deleting a volume group will erase all data on it.
```

5. **Caution:** Deleting a volume group will erase all data on it.
Manage User Accounts

You can use the Accounts page to manage user accounts for your Tenable Core instance.

To manage Tenable Core user accounts:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   The System page appears.

2. In the left navigation bar, click Accounts.
   The Accounts page appears.

Do any of the following:

- Create a new user account, as described in Create New User Account.
- Edit a user account, as described in Edit a User Account.
- Delete a user account, as described in Delete a User Account.
Create New User Account

Required User Role: Administrator

You can create a new user account from the Accounts page.

To create a new user account:

1. Log in to Tenable Core, as described in Log In to Tenable Core.

2. In the left navigation bar, click Accounts.
   
The Accounts page appears.

3. Click Create New Account.
   
The Create New Account window appears.

4. In the Full Name box, type the user’s full name.

5. In the User Name box, type a username for the user account.

6. In the Password box, type a password for the user account.

7. In the Confirm box, retype the password.

8. Click Create.
   
Tenable Core creates the new account and displays it on the Accounts page.

What to do next:

- (Optional) If you want to configure the user account, see Edit a User Account.
- (Optional) If you want to delete the user account, see Delete a User Account.
Edit a User Account

**Required User Role:** Administrator

You can edit a user account configuration, including the user’s full name, password, roles, access, and public SSH keys.

Before you begin:

To edit a user account:

1. Log in to Tenable Core, as described in [Log In to Tenable Core](#).
2. In the left navigation bar, click **Accounts**.

   The **Accounts** page appears.
3. Click the user account you want to edit.

   The account page for the user account appears.
4. On the user account page, you can:

<table>
<thead>
<tr>
<th>Section</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Full Name</strong></td>
<td>Type a name for the user account.</td>
</tr>
<tr>
<td><strong>Roles</strong></td>
<td>To grant the user account administrator access, select the <strong>Server Administrator</strong> check box.</td>
</tr>
<tr>
<td></td>
<td>To remove administrator access from the user account, clear the <strong>Server Administrator</strong> check box.</td>
</tr>
<tr>
<td><strong>Access</strong></td>
<td>To lock the user account, select the <strong>Lock Account</strong> check box to lock the user account.</td>
</tr>
<tr>
<td></td>
<td>To unlock the user account, clear the <strong>Lock Account</strong> check box to unlock the user account.</td>
</tr>
<tr>
<td></td>
<td>To configure the account to remain unlocked indefinitely:</td>
</tr>
</tbody>
</table>

**Note:** If you do not configure the account to remain unlocked indefinitely:
Tenable Core automatically locks the account on the set expiration date.

1. Click **Never lock account**.
   
   The **Account Expiration** window appears.

2. Select the **Never lock account** option.

3. Click **Change**.
   
   Tenable Core sets the account to remain unlocked indefinitely.

   - Select an expiration date for the account:
     
     1. Click **Never lock account**.
        
        The **Account Expiration** window appears.

     2. Select the **Lock account on** option.

     3. Click the box next to the **Lock account on** option.
        
        A calendar drop-down box appears.

     4. In the calendar drop-down box, select the date when you want the account to expire.

     5. Click **Change**.
        
        Tenable Core sets the expiration date for the user account.

**Password**

- To set a new user account password:

  1. Click **Set Password**.
     
     The **Set Password** window appears.

  2. In the **New Password** box, type the password you want to use for the account.

  3. Click **Set**.
Tenable Core updates the user account password.

- To force a user to change their user account password:
  1. Click **Force Change**.

     The **Force password change** window appears.
  2. Click **Reset**.

     Tenable Core disables the password for the user account. The user must change the password on the next log in attempt.

- Configure the user account password to remain active indefinitely:

  **Note:** If you do not configure the password to remain active indefinitely, Tenable Core automatically expires the password on the set expiration date.

  1. Click **Never expire password**.

     The **Password Expiration** window appears.
  2. Select the **Never expire password** option.
  3. Click **Change**.

     Tenable Core sets the password to remain active indefinitely.

- Select an expiration date for the user account password:

  1. Click **Never expire password**.

     The **Password Expiration** window appears.
  2. Select the **Require password change every [blank] days** option.
  3. In the **Require password change every [blank] days** section, type the number of days that you want to pass between password expiration dates (e.g., type 90 if you want the password to expire every 90 days).
4. Click **Change**.

    Tenable Core sets the expiration date for the user account password.

| Authorized Public SSH Keys | To add a public SSH key to the user account:
|---------------------------|---------------------------------------------------------------|
|                           | 1. In the **Authorized Public SSH Keys** table, click the [+] icon.  
|                           | The **Add public key** window appears.                         |
|                           | 2. In the text box, type or paste your public SSH key.          |
|                           | 3. Click **Add key**.                                           |
|                           | Tenable Core adds the SSH key to the user account.              |

|                           | To remove a public SSH key:
|---------------------------|---------------------------------------------------------------|
|                           | 1. In the **Authorized Public SSH Keys** table, next to the key you want to remove, click the [-] icon.  
|                           | Tenable Core removes the SSH key from your account.            |
Delete a User Account

**Required User Role:** Administrator

You can delete a user account from the Accounts page.

To delete a new user account:

1. Log in to Tenable Core in a browser, as described in [Log In to Tenable Core](#).
2. In the left navigation bar, click Accounts.
   
The Accounts page appears.
3. Click the user account you want to delete.
   
The account page for the user account appears.
4. In the upper-right corner, click Delete.
   
The delete window for the user account appears.
5. (Optional), if you want to permanently delete files attached to the user account, select the Delete Files check box.
   
   **Note:** If you do not delete them, the files remain attached to the Tenable Core instance, along with their existing access permissions. Users who were previously granted access can still access the files.
6. Click Delete.
   
   Tenable Core delete the user account.
Manage Services

You can use the **Services** page to view information about targets, system services, sockets, timers, and paths.

To manage Tenable Core services:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).

   The **System** page appears.

2. In the left navigation bar, click **Services**.

   The **Services** page appears.

You can:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Targets</strong></td>
<td>1. Click <strong>Stop, Start, Restart</strong>, or <strong>Reload</strong>.</td>

|                  |   2. Click **Stop, Start, Restart**, or **Reload**.  
|                  |     **Note**: Restarting a service will completely stop and restart the service. Reloading a service will only reload the service's configuration files.  
|                  |     The system changes the status of the service.  |
| **Paths**        | - View a list of path services.  
|                  | - Click a row to view detailed information about a service.  
|                  | - To change the status of a service:
1. Click a row.

The service details page appears.

2. Click **Stop, Start, Restart**, or **Reload**.

**Note**: Restarting a service will completely stop and restart the service. Reloading a service will only reload the service's configuration files.

The system changes the status of the service.
Create a Timer

To create a timer:

1. In the left navigation pane, click the Services option. The Services page displays.
2. In the Services page heading, click the Create Timers button. A new window appears.
3. Enter the Service Name, Description, Command, and Run information.
4. Click Save. The new timer will display in the enabled section of the list.
Generate a Diagnostic Report

You can use diagnostic reports to assist with troubleshooting Tenable Core.

To generate a diagnostic report for troubleshooting:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   - The System page appears.
2. In the left navigation bar, click Diagnostic Reports.
   - The Diagnostic Reports page appears.
3. Click the Create Report button.
4. A new window with a status bar will appear as the report generates.
5. When the report is complete, the status will display Done.
6. Click the Download Report button to save and print the report.
Access the Terminal

The Terminal page provides a console to access a user-specific command line interface.
Configure Tenable.sc in Tenable Core

Tenable.sc is a comprehensive vulnerability analysis solution that provides complete visibility into the security posture of your distributed and complex IT infrastructure. SecurityCenter consolidates and evaluates vulnerability data from across your entire IT infrastructure, illustrates vulnerability trends over time, and assesses risk with actionable context for effective remediation prioritization.

From the Tenable.sc page in Tenable Core, you can view log data and synchronize your ports to Tenable Core’s firewall.

**Tip:** From this page, you can also access the Tenable.sc interface and configure your instance of Tenable.sc, as described in Configure Tenable.sc in the Tenable.sc User Interface.

For more information about Tenable.sc, see the Tenable.sc User Guide.

To synchronize ports in the Tenable Core firewall:

1. In the **SECURITYCENTER WEBSERVER CONFIGURATION**: section, click the number in the **Listening Configuration** field.

   ![Listening Configuration](image)

   The **CONFIGURE LISTENING SETUP** dialogue box appears.
2. In the **Ports (all IP addresses):** field, enter all applicable ports, separating them with commas.

3. Check the **Open matching firewall ports:** box.

4. Click **Change.**
   
   A success message appears briefly in the dialogue box. The dialogue box then closes.

To view Tenable.sc logs:

1. Select the desired log from the drop-down box.

2. Click **View Log.**
   
   The log appears in the text box.
Configure a Proxy Server

If your organization configured a proxy server to conceal your IP address, share an internet connection on your local network, or control internet access on your network, set the proxy configuration in Tenable Core.

Before you begin:

- Log in to Tenable Core in a browser, as described in Log In to Tenable Core.

To configure a proxy server:

1. In the left navigation bar, click Update Management.

   The Updates page appears.

2. In the Proxy Host box, type the hostname and port for your proxy server in the format host-name:port (e.g., https://192.0.2.1:2345).

3. (Optional) In the Proxy Username box, type a username for your proxy server.

4. (Optional) In the Proxy Password box, type a password for the proxy.

5. Click Save Proxy.

   The system initiates your proxy configuration.
Start, Stop, or Restart Your Application

To start, stop, or restart your application via the UI:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).
   The System page appears.

2. In the left navigation bar, click Tenable.sc.
   The application page appears.

3. In the Installation Info section, click Start, Stop, or Restart.

To start, stop, or restart your application via the CLI:

1. Log in to Tenable Core via [the Terminal page](#) or command line interface (CLI).
   The command line appears.

2. To change the status of your application, see Tenable.sc see, [Start, Stop, or Restart Tenable.sc](#) in the Tenable.sc User Guide.
Manage Updates

You can use the **Updates Management** page and the **Software Updates** page to manage your Tenable Core and application updates.

If your deployment is online, Tenable recommends:

- Configuring automatic updates. For more information, see [Configure Automatic Updates](#).
- Performing on-demand updates, as needed. For more information, see [Update On Demand](#).

If your deployment is offline, you can perform offline updates. For more information, see [Update Tenable Core Offline](#).
Configure Automatic Updates

By default, automatic updates are enabled on Tenable Core.

If Tenable Core is installed or deployed in an online environment, Tenable recommends keeping automatic updates enabled. When performing an automatic update, Tenable Core retrieves and installs:

- The latest version of Tenable.sc.
- The latest version of CentOS included in Tenable Core.
- The latest version of any additional packages required by Tenable Core.
- The latest version of any additional CentOS packages you installed.

To configure automatic updates:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.

   The **System** page appears.

2. In the left navigation pane, click **Update Management**.

   The **Update Management** page appears.

3. In the **AUTOMATIC UPDATES** section, click the link in Scheduled updates can be enabled/disabled Here.

   The **Services** details page appears, displaying the details for the tenablecore.update.timer service.

4. Confirm that **Automatic Startup** is enabled.

   **Note:** Tenable does not recommend disabling automatic updates or otherwise modifying Automatic Startup for the tenablecore.update.timer service.

5. Review the schedule for the automatic updates and modify, if needed, as described in Configure Your Automatic Update Schedule.

What to do next:
If the update included any of the following packages, restart Tenable Core as described in Start, Stop, or Restart Your Application.

- kernel
- glibc
- linux-firmware
- systemd
Configure Your Automatic Update Schedule

By default, automatic updates are enabled on Tenable Core.

If Tenable Core is installed or deployed in an online environment, Tenable recommends keeping automatic updates enabled.

To configure the schedule for your automatic updates:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   The System page appears.

2. In the left navigation pane, click Update Management.
   The Update Management page appears.

3. In the AUTOMATIC UPDATES section, click the link in Timer Config Line.
   The Edit Timer Configuration window appears.

4. Modify the schedule.

   **Note:** If you set both a Day of week and a Day of month, the system only performs updates on days when those two parameters are true. For example, if you set Wednesday as the Day of week and 8 as the Day of month, Tenable Core performs automatic updates only on the 8th of the month if it is a Wednesday.

   **Tip:** Tenable Core uses Eastern Time as your default time zone, unless you modify it as described in Edit Your Time Settings.

5. Click Save.

   Tenable Core modifies the schedule for automatic updates.
Update On Demand

If Tenable Core is installed or deployed in an online environment, you can perform updates on demand. When updating on demand, Tenable Core retrieves and installs:

- The latest version of Tenable.sc.
- The latest version of CentOS included in Tenable Core.
- The latest version of any additional packages required by Tenable Core.
- The latest version of any additional CentOS packages you installed.

Before you begin:

- Manually refresh the packages:
  a. Log in to Tenable Core via the [Terminal page](#) or command line interface (CLI).
     The command line appears.
  b. Run the following command:

     ```bash
     sed -i.orig '/self.cache_age == 0/s/=/</' /usr/share/PackageKit/helpers/yum/yumBackend.py
     ```

To update on demand:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).
   The [System](#) page appears.

2. In the left navigation pane, click [Software Updates](#).
   The [Software Updates](#) page appears.

3. Click [Check for Updates](#).
   The page refreshes and displays available updates.

4. If updates are available, click [Install all updates](#).
   Tenable Core performs the updates.
What to do next:

- If the update included any of the following packages, restart Tenable Core as described in Start, Stop, or Restart Your Application.
  - kernel
  - glibc
  - linux-firmware
  - systemd
Update Tenable Core Offline

Tenable recommends applying all offline updates, in order, to your offline Tenable Core machine. Do not skip offline updates.

For information about the contents of individual offline update files, see the Tenable Core Release Notes.

To upload a Tenable Core offline update .iso file:

1. Navigate to the Tenable Core Offline Update ISO section of the Tenable Downloads page.
2. Click and download the offline update .iso file.
3. Rename the offline update .iso file as tenable-offline-updates.iso.
4. Upload the file via scp. For example:

```
scp local-isofile.iso user@host:/srv/tenablecore/offlineiso/tenable-offline-updates.iso
```

**Note:** The target line may vary; however, the destination must be the following path:

```
/srv/tenablecore/offlineiso/tenable-offline-updates.iso
```

After the upload, updates are applied automatically at the configured time or on the next Tenable Core reboot. You can also manually install updates.

**Note:** Once the .iso file is uploaded, no further action is needed. However, you can make subsequent updates by replacing the existing .iso file if desired.
Manage Certificates

From the **SSL/TLS Security Certificates** page, you can manage the certificates used by Tenable Core and your application.

- Manage the Server Certificate
- Upload a Certificate for a Trusted Certificate Authority
- Use Different Certificates for Tenable Core and Your Application
Manage the Server Certificate

When you first deploy or install Tenable Core, Tenable provides a default server certificate for accessing the Tenable Core and application interfaces.

**Tip:** By default, Tenable Core uses the same certificates for Tenable Core as well as Tenable.sc. To use a different server certificate for Tenable.sc, see Use Different Certificates for Tenable Core and Your Application.

**Note:** The default certificate is not signed by a recognized certificate authority (CA). If your browser reports that the Tenable Core or application server certificate is untrusted, Tenable recommends uploading a custom server certificate signed by a trusted certificate authority (CA) for Tenable Core and application use. For more information, see Upload a Custom Server Certificate. Alternatively, you can download the Tenable-provided CA certificate (cacert.pem) for your server certificate and upload it to your browser.

If you upload a custom server certificate signed by a custom CA, you must also provide certificates in the chain to validate your custom server certificate.

For more information, see:

- [Upload a Custom Server Certificate](#)
- [Remove a Custom Server Certificate](#)
Upload a Custom Server Certificate

If you do not want to use the Tenable-provided server certificate, you can upload a custom server certificate to Tenable Core. For more information, see Manage the Server Certificate.

You cannot upload multiple custom server certificates to Tenable Core. Uploading a new file replaces the existing file.

**Tip:** By default, Tenable Core uses the same certificates for Tenable Core as well as Tenable.sc. To use a different server certificate for your application, see Use Different Certificates for Tenable Core and Your Application.

Before you begin:

- Confirm your custom server certificate and key files use the *.der, *.pem, or *.crt extension.
- Move the custom server certificate and key files to a location accessible from your browser.

To upload a custom server certificate for Tenable Core:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core. The System page appears.
2. In the left navigation pane, click SSL/TLS Certificates. The SSL/TLS Certificates page appears.
3. Click the System Certificate tab.
4. Locate the Update Certificate section in the SERVER CERTIFICATES section.
5. Provide your **Server Certificate**.
   a. Click **Choose File**.
      The upload window appears.
   b. Browse to and select the file.
      Tenable Core loads the file.

6. Provide your **Server Key**.
   a. Click **Choose File**.
      The upload window appears.
   b. Browse to and select the file.
      Tenable Core loads the file.

7. (Optional) If your custom server certificate is signed by a custom CA that requires an intermediate certificate to validate the custom server certificate, provide your **Intermediate Certificate**.
   a. Click **Choose File**.
      The upload window appears.
b. Browse to and select the file.

Tenable Core loads the file.

8. (Optional) If your custom server certificate is signed by a custom CA, upload your **Custom Root CA Certificate**.
   a. Click Choose File.
      The upload window appears.
   b. Browse to and select the file.
      Tenable Core loads the file.

9. Click **Install Server Certificates**.

Tenable Core uploads the files. A success message appears to confirm the upload succeeded.

10. In the left navigation pane, click **Services**.

The **Services** page appears.

11. Restart the **Cockpit** service, as described in **Manage Services**.

The **Cockpit** service restarts and enables the new certificate.
Remove a Custom Server Certificate

If you no longer want to use your custom server certificate for Tenable Core, you can remove the certificate and revert to using a Tenable-provided server certificate. For more information, see Manage the Server Certificate.

To remove a custom server certificate and revert to the Tenable-provided default certificate:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   
The System page appears.
2. In the left navigation pane, click SSL/TLS Certificates.
   
The SSL/TLS Certificates page appears.
3. Click the System Certificate tab.
4. In the SERVER CERTIFICATES section, in the Update Certificate section, click Reset Server Certificates.
   
   A confirmation window appears.
5. Click Reset.
   
   A success message appears to confirm the reset succeeded.
Upload a Certificate for a Trusted Certificate Authority

You can upload a trusted certificate authority (CA) certificate for any of the following purposes:

- You want to use certificate authentication for user accounts on Tenable.sc.
- You want to configure manual Nessus SSL certificate exchange to authenticate Tenable.sc to its Nessus scanners.
- You enabled the **Verify Hostname** scanner setting in Tenable.sc and you want to use a trusted CA cert in Tenable Core to verify the Nessus server certificate.

You do not need to upload a trusted CA certificate for any other reasons. You can upload any number of trusted CA certificates to Tenable Core.

**Note:** By default, Tenable Core uses the same certificates for Tenable Core as well as Tenable.sc. To decouple the certificates used for your Tenable Core system and your application, see [Use Different Certificates for Tenable Core and Your Application](#).

If you decouple the certificates, Tenable Core disregards the custom CA certificate configuration on the **System Certificate** tab. Tenable Core does not use custom CA certificates for reasons other than the application use.

To view details about an existing certificate, click to expand the **Filename** section for a certificate. To remove an existing certificate, select the certificate and click the **Delete** button.

Before you begin:

- Confirm the trusted CA certificate is in `.der`, `.pem`, or `.crt` format.
- Move the trusted CA certificate to a location accessible from your Tenable Core server.

Upload a trusted CA certificate:

1. Log in to Tenable Core via the user interface, as described in [Log In to Tenable Core](#).
   
   The **System** page appears.

2. In the left navigation pane, click **SSL/TLS Certificates**.
   
   The **SSL/TLS Certificates** page appears.

3. Click the **System Certificate** tab.
4. In the **TRUSTED CERTIFICATE AUTHORITIES** section, in the **Add Certificate Authority** section, next to **Certificate**, click **Choose File**.

The upload window appears.

5. **Browse to and select the certificate file.**

Tenable Core uploads the certificate file.

6. **Click **Install Certificate Authority**.**

A success message appears to confirm the upload succeeded.
Use Different Certificates for Tenable Core and Your Application

By default, Tenable Core uses the same certificates for Tenable Core as well as Tenable.sc. If needed, you can decouple your system and application certificates and customize them independently.

Before you begin:

- Upload a custom server certificate for Tenable Core, as described in Upload a Custom Server Certificate.

To decouple and customize your application certificates:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   The System page appears.
2. In the left navigation pane, click SSL/TLS Certificates.
   The SSL/TLS Certificates page appears.
3. Click the application tab.
   The application tab appears.
   The application tab refreshes to display the settings in edit mode.
5. Remain on the application tab and configure the settings for your application-specific server certificate, as described in Upload a Custom Server Certificate.
6. Remain on the application tab and configure the settings for one or more custom certificate authority (CA) certificate, as described in Upload a Certificate for a Trusted Certificate Authority.

Note: If you upload a custom CA certificate on the application tab, Tenable Core disregards the custom CA certificate configuration on the System Certificate tab. Tenable Core does not use custom CA certificates for reasons other than the application use described in Upload a Certificate for a Trusted Certificate Authority.
Application Data Backup and Restore

Backup and restore requires a connection to a remote storage host. When Tenable Core begins a scheduled or on-demand backup, your files are temporarily stored in /opt/tenablecore/backup/spool before being sent to the configured remote storage host.

Later, you can restore your backup data by uploading your backup file to Tenable Core.

For more information, see:

- Configure a Remote Storage Host
- Perform an On-Demand Backup
- Change the Scheduled Backup Time
- Restore a Backup

If you want to enable or disable a scheduled backup, click **Scheduled backups can be configured Here.**

---

**Note:** During a backup or a restore, Tenable Core stops the Tenable.sc application service. You cannot use Tenable.sc or the Tenable.sc interface during this time.

After the backup or restore completes, your services restart and Tenable.sc resumes normal function.

**Tip:** A VM snapshot backs up the entire VM (application installed files, application data, OS files and configurations.) To take a snapshot of your VM, see **Take a Snapshot.**

---

Remote Storage Host Requirements

The location where you store your backups must:

- Have rsync installed.
- Have an SSH server installed and running.
- Have sufficient storage space to hold your application’s backup data. While application data size and file compression varies, you could safely size your remote storage host by doubling the disk...
space currently in use on your application.

- Have a user with write permissions to manage the remote storage host location.

**Note:** Tenable Core does not manage your remote storage system. If you are concerned about space on your remote storage system, remove backup files manually when you no longer need them.
Configure a Remote Storage Host

Before you back up application data, you must establish a remote storage host with SSH key authentication and configure that host in Tenable Core.

Before you begin:

- Confirm your SSH private key for authenticating to the remote storage host is in OpenSSH key format.
- Prepare your remote storage host environment, as described in the Remote Storage Host Requirements.
- Confirm that you can log in to your remote storage host using SSH key authentication.

To configure your remote storage host:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   
   The System page appears.

2. In the left navigation bar, click Remote Storage.
   
   The Remote Storage Configuration page appears.

3. In the Remote Host box, type the hostname for the remote storage host where you want to store your backup files.

4. In the Remote Path: box, type the location on the remote host where you want to store your backup files.

5. In the User box, type the username for a user on the remote host with edit permissions for the remote path location.

6. In the SSH private key box, paste the SSH private key for authenticating to the remote storage host.

7. Click Save Configuration.

What to do next:
• Perform a backup, as described in Perform a Backup on Demand.

• (Optional) Change your automatic backup schedule, as described in Change Your Automatic Backup Schedule.

• (Optional) Restore a backup, as described in Restore a Backup.
Perform an On-Demand Backup

Perform a backup of your application data anytime between scheduled backups. For more information about scheduled backups, see Change the Scheduled Backup Time.

**Note:** Your backup may fail if it occurs during active Tenable.sc processes. To avoid backup failures, Tenable recommends that you coordinate your on-demand and scheduled backups around Tenable.sc blackout windows. For more information about Tenable.sc blackout windows, see Blackout Windows in the Tenable.sc User Guide.

**Note:** During a backup or a restore, Tenable Core stops the Tenable.sc application service. You cannot use Tenable.sc or the Tenable.sc interface during this time.

After the backup or restore completes, your services restart and Tenable.sc resumes normal function.

Before you begin:

- Configure your remote storage host, as described in Configure Remote Storage Host.

To perform an on-demand backup:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   
   The System page appears.

2. In the left navigation bar, click Backup/Restore.
   
   The Backup/Restore page appears.

3. In the AVAILABLE MODULES section, select the box next to the application you want to back up.

4. Click Take Backup Now.
   
   The BACKUP IN PROGRESS window appears. The window disappears after the system completes the backup.

What to do next:

- (Optional) Restore the backup, as described in Restore a Backup.
Change the Scheduled Backup Time

By default, Tenable Core backs up your applications daily at 2:30 AM local time. You can edit your schedule preferences in Tenable Core to change the time and frequency of your scheduled backups.

For more information about managing your time preferences, see Edit Your Time Settings.

Note: Tenable Core cannot perform a backup (scheduled or on-demand) until you configure a remote storage host on your computer. For more information, see Configure a Remote Storage Host.

Note: Your backup may fail if it occurs during active Tenable.sc processes. To avoid backup failures, Tenable recommends that you coordinate your on-demand and scheduled backups around Tenable.sc blackout windows. For more information about Tenable.sc blackout windows, see Blackout Windows in the Tenable.sc User Guide.

To change the scheduled backup time:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.

   The System page appears.

2. In the left navigation bar, click Backup/Restore.

   The Backup/Restore page appears.

3. In the AUTOMATIC BACKUPS table, locate the Timer Config Line row.

4. Click Edit.

   The EDIT TIMER CONFIGURATION window appears.

5. On the EDIT TIMER CONFIGURATION window, update the configuration based on your desired backup frequency:

   Note: If you specify a day of the week and a day of the month for your scheduled backups, Tenable Core performs the backups only when those values overlap. For example, if you specify Monday and 15, Tenable Core performs your backups only on Mondays that fall on the 15th day of the month.

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• In the Day of Week and Day of Month boxes, type an asterisk (*).</td>
</tr>
<tr>
<td></td>
<td>• In the Hour box, type the hour when you want Tenable Core to per-</td>
</tr>
</tbody>
</table>
form a backup as an integer between 0 and 23.

- In the **Minute** box, type the minute when you want Tenable Core to perform a backup as an integer between 0 and 59.

<table>
<thead>
<tr>
<th>Weekly</th>
<th>In the <strong>Day of Week</strong> box, type the day of the week when you want Tenable Core to perform a backup (e.g., <em>Monday</em> or <em>Mon</em>).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>In the <strong>Day of Month</strong> box, type an asterisk (*).</td>
</tr>
<tr>
<td></td>
<td>In the <strong>Hour</strong> box, type the hour you want Tenable Core to perform a backup as an integer between 0 and 23.</td>
</tr>
<tr>
<td></td>
<td>In the <strong>Minute</strong> box, type the minute you want Tenable Core to perform a backup as an integer between 0 and 59.</td>

</tr>
<tr>
<td></td>
<td>In the <strong>Minute</strong> box, type the minute you want Tenable Core to perform a backup as an integer between 0 and 59.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

Your scheduled backup time updates.

**What to do next:**

- (Optional) Perform an on-demand backup, as described in [Perform a Backup On Demand](#).
- (Optional) Restore the backup, as described in [Restore a Backup](#).
Restore a Backup

You can restore a backup to return an application to a prior state.

**Note:** During a backup or a restore, Tenable Core stops the Tenable.sc application service. You cannot use Tenable.sc or the Tenable.sc interface during this time.

After the backup or restore completes, your services restart and Tenable.sc resumes normal function.

Before you begin:

- Check your firewall settings and confirm that your computer can access port 8090 on Tenable Core, as described in Access Requirements.

To restore an application backup:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.

   The System page appears.

2. In the left navigation bar, click Backup/Restore.

   The Backup/Restore page appears.

3. In the UPLOAD AND RESTORE section, click Choose a file.

   Your file explorer appears.

4. Select the desired backup file.

5. Click Open.

   A details window for the backup appears.

6. If prompted, confirm that you want to upgrade or downgrade your current Tenable Core application version to match the application version from your backup file.

   a. Click Install Correct Version.

      A confirmation window appears.

   b. Click Replace.
Tenable Core installs the correct version of your application.

The restore widow appears.

7. Click **Restore**.

The system restores your backup to Tenable Core.

**Note**: Do not log out of Tenable Core or close your browser until after the **Uploading the archive** task is complete. If you end your session early, the restore fails.

When the restore finishes, a success message appears.

**Tip**: If the restore attempt fails, an error message appears with details and remediation instructions. Resolve the errors and click **Retry**.
**SNMP Agent Configuration**

If your organization uses a Simple Network Monitoring Protocol (SNMP) network management station (NMS) for device monitoring, you can install a `net-snmp` agent onto Tenable Core to report device data to your NMS.

You can use the user interface to configure common SNMPv2 or SNMPv3 settings. To configure other advanced or uncommon SNMP settings, use the CLI.

- [Configure an SNMP Agent via the User Interface](#)
- [Configure an SNMP Agent via the CLI](#)

To stop, start, restart, or reload the SNMP service in Tenable Core, or to view SNMP logs, see [Manage Services](#).
Configure an SNMP Agent via the User Interface

**Required User Role:** Administrator with *Reuse my password for privileged tasks* enabled

If your organization uses a Simple Network Monitoring Protocol (SNMP) network management station (NMS) for device monitoring, you can install a `net-snmp` agent onto Tenable Core to report device data to your NMS.

You can use the user interface to configure common SNMPv2c or SNMPv3 settings. To configure other advanced or uncommon SNMP settings, use the CLI as described in Configure an SNMP Agent via the CLI.

To install and configure an SNMP agent on Tenable Core via the user interface:

1. Log in to Tenable Core via the user interface, as described in Log In to Tenable Core.
   - The **System** page appears.
2. In the left navigation bar, click **SNMP**.
   - If you already installed an SNMP agent on Tenable Core, the **SNMP** page appears. If you do not have an SNMP agent installed on Tenable Core, the **Install SNMP Packages** window appears.
3. (Optional) In the **Install SNMP Packages** window, click **Install SNMP** to install the SNMP service.
   - Tenable Core installs the SNMP service and opens inbound ports 161 and 162 on Tenable Core.
   - The **SNMP** page appears.
4. In the **SNMP common setup** section, configure the contact properties you want to appear on your NMS for this instance of Tenable Core.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>A name, email address, or other identifier for the person you want to list as the contact for questions about this instance of Tenable Core.</td>
</tr>
<tr>
<td>Location</td>
<td>A geographic, organizational, or other location descriptor for the person you want to list as the contact for questions about this instance of Tenable Core.</td>
</tr>
</tbody>
</table>
5. If you want to grant an SNMPv2c NMS access to Tenable Core, in the **SNMPv2c access control setup** section, configure one or both of the settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>read-only access community name</td>
<td>Specifies the read-only community string for the SNMPv2c NMS.</td>
</tr>
<tr>
<td>read-write access community name</td>
<td>Specifies the read-write community string for the SNMPv2c NMS.</td>
</tr>
</tbody>
</table>

6. If you want to grant an SNMPv3 NMS read-only access to Tenable Core, in the **SNMPv3 access control setup** section, configure the settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read-only Hash algorithm</td>
<td>Specifies the read-only hash algorithm for the SNMPv3 NMS.</td>
</tr>
<tr>
<td>Read-only access username</td>
<td>Specifies the username and password for an account on the SNMPv3 NMS.</td>
</tr>
<tr>
<td>Read-only access user password</td>
<td></td>
</tr>
</tbody>
</table>

7. If you want to grant an SNMPv3 NMS read-write access to Tenable Core, in the **SNMPv3 access control setup** section, configure the settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read-write Hash algorithm</td>
<td>Specifies the read-write hash algorithm for the SNMPv3 NMS that you want to grant read-write access on Tenable Core.</td>
</tr>
<tr>
<td>Read-write access username</td>
<td>Specifies the username and password for an account on the SNMPv3 NMS.</td>
</tr>
<tr>
<td>Read-write access user password</td>
<td></td>
</tr>
</tbody>
</table>

8. Click **Save Configuration**.
Tenable Core saves your SNMP configuration.
**Configure an SNMP Agent via the CLI**

**Required User Role:** Root user

If your organization uses a Simple Network Monitoring Protocol (SNMP) network management station (NMS) for device monitoring, you can install a net-snmp agent onto Tenable Core to report device data to your NMS.

To install and configure an SNMP agent on Tenable Core via the CLI:

1. Prepare the `net-snmp` agent configuration file and add it to Tenable Core, as described in the Net-SNMP Documentation.
2. Log in to Tenable Core via the Terminal page or command line interface (CLI).
3. In the `/etc/snmp/` directory, open the `snmpd.local.conf` file.
4. Locate the `IncludeFile` line in the file.
5. Comment out the `IncludeFile` line to instruct Tenable Core to ignore all current and future configurations on the SNMP page of the Tenable Core user interface.

Tenable Core ignores SNMP configurations in the Tenable Core user interface.
Take a Virtual Machine Snapshot

You can take a snapshot to back up the entire machine, including application-installed files, application data, OS files and configurations.

Before you begin:

- Stop your instance of Tenable Core + Tenable.sc, as described in Start, Stop and Restart Tenable Core.

To take a snapshot of Tenable Core:

1. Take a snapshot, as described in the documentation for your environment.
